Contents

Preface, vii

SECTION I. GENOME, EPIGENOME, PROTEOME, AND CELL SIGNALING

Summary, 1

Janet Rossant

1 Pluripotency in the Embryo and in Culture, 3

Jennifer Nichols and Austin Smith

2 Genomic Imprinting and Epigenetic Control of Development, 17

Andrew Fedoriw, Joshua Mugford, and Terry Magnuson

3 microRNAs as Developmental Regulators, 33

Kathryn N. Ivey and Deepak Srivastava

4 Proteomic Analysis of Stem Cell Differentiation and Early Development, 43

Dennis Van Hoof, Jeroen Krijgsveld, and Christine Mummery

5 Signaling in Cell Differentiation and Morphogenesis, 57

M. Albert Basson

SECTION II. MORPHOGENETIC PROCESSES

Summary, 79

W. James Nelson

6 Branching Morphogenesis: From Cells to Organs and Back, 81

Amanda Ochoa-Espinosa and Markus Affolter

7 Polarity in Mammalian Epithelial Morphogenesis, 95

Julie Roignot, Xiao Peng, and Keith Mostov

8 Cell Division Modes and Cleavage Planes of Neural Progenitors during Mammalian Cortical Development, 111

Fumio Matsuzaki and Atsunori Shitamukai

9 Epithelial-Mesenchymal Transition: General Principles and Pathological Relevance with Special Emphasis on the Role of Matrix Metalloproteinases, 127

Paola Nisticò, Mina J. Bissell, and Derek C. Radisky

10 Molecular Mechanisms of Cell Segregation and Boundary Formation in Development and Tumorigenesis, 137

Eduard Batlle and David G. Wilkinson

11 The Synchrony and Cyclicity of Developmental Events, 151

Yumiko Saga

12 Intercellular Interactions, Position, and Polarity in Establishing Blastocyst Cell Lineages and Embryonic Axes, 167

Robert O. Stephenson, Janet Rossant, and Patrick P.L. Tam

13 The Dynamics of Morphogenesis in the Early Mouse Embryo, 183

Jaime A. Rivera-Pérez and Anna-Katerina Hadjantonakis

SECTION III. SIGNALS AND SWITCHES IN LINEAGE SPECIFICATION, TISSUE DIFFERENTIATION, AND ORGANOGENESIS

Summary, 201

Patrick P.L. Tam

14 Hematopoiesis, 205

Michael A. Rieger and Timm Schroeder

15 Primordial Germ Cells in Mice, 223

Mitunori Saitou and Masashi Yamaji

16 Signals and Switches in Mammalian Neural Crest Cell Differentiation, 243

Shachi Bhatt, Raul Diaz, and Paul A. Trainor

17 Molecular Control of Neurogenesis: A View from the Mammalian Cerebral Cortex, 263

Ben Martynoga, Daniela Drechsel, and François Guillemot

18 Development and Homeostasis of the Skin Epidermis, 277

Panagiota A. Sotiropoulou and Cedric Blanpain

19 Adipogenesis, 297

Kelesha Sarjeant and Jacqueline M. Stephens

Contents

- 20 Blood and Lymphatic Vessel Formation, 317

Preface

DURING THE PAST DECADE, research in developmental biology has undergone a dramatic change brought about by the availability of whole genome sequences from diverse organisms, the availability of transcriptomes and epigenomes, advanced imaging techniques, and increased understanding of the role of stem cells in organ and tissue development and regeneration. These advances have been integrated with traditional approaches of genetic manipulations and detailed phenotypic analyses in experimental model organisms such as the mouse. The information obtained from these studies has dramatically increased our understanding of the cellular origins of organs and tissues and provided deeper insights into the regulation of gene activity in a multitude of developmental processes and the mechanisms coordinating cellular reorganization in morphogenesis. With the integration of these findings, new questions about developmental processes have arisen, along with the hope of potential interventions in developmental processes for tissue regeneration and disease therapies.

This book provides a contemporary overview of the conceptual framework of molecular and cellular mechanisms of mammalian development, and a glimpse into future directions in mammalian developmental biology and its relevance to cellular and tissue therapy. Major areas of focus are transcriptional and epigenetic switches and the activity of genetic networks in cell differentiation, the role of signaling pathways, and tissue modeling and organ formation. Another is the translation of basic knowledge of developmental processes into stem cell biology, directed differentiation of pluripotent or lineage-biased progenitors, and the potential for regenerative medicine.

The chapters are written by experts in these different areas of developmental biology and are organized into three main topic areas—Section I: Genome, Epigenome, Proteome, and Cell Signaling; Section II: Morphogenetic Processes; and Section III: Signals and Switches in Lineage Specification, Tissue Differentiation, and Organogenesis. The content showcases how genetic manipulation and a deep mechanistic understanding of cell function and tissue interactions in embryos together provide insights into the developmental mechanisms underlying lineage specification, cell differentiation, and morphogenesis. Chapters in Section III of the book cover a selection of organ and tis-

sue systems. The criterion for the choices of topics is that they provide a deeper knowledge of the morphogenetic processes at the cellular and tissue levels. These topics also highlight the intricacy of the intersection of signaling and genetic activity that control cell fate and differentiation, which has significant implications for our understanding of tissue repair and cell-based therapy.

The book is aimed at senior undergraduates interested in the scope of modern developmental biology, graduate students and postdoctoral fellows who are beginning to explore the mouse as a model system for studying vertebrate development and its relevance to human diseases, and established scientists in fields outside the traditional areas of developmental biology who are looking to apply their knowledge and expertise in new ways.

We are grateful to the authors who took time to contribute chapters to this book and many anonymous colleagues for their valuable input to the peer review of the manuscripts. This book would not have become a reality without the hard work of the staff at Cold Spring Harbor Laboratory Press: Richard Sever and David Crotty for their advice and guidance, Inez Sialiano for an excellent job managing the submission and review of manuscripts, and Diane Schuchbach, Kathleen Bubbeo, and other members of the production team who produced the electronic versions of the text and the printed book that you are about to peruse.

This book is dedicated to the memory of Dr. Larysa Pevny who co-authored the chapter on Eye Development and Retinogenesis. Sadly, she passed away before seeing this book appear in print. Larysa made many significant contributions to the field of *Sox* gene biology; moreover, she left an indelible impact on the new generation of developmental biologists, in part through her role as Instructor and Lecturer for the Cold Spring Harbor Laboratory Course on Molecular Embryology of the Mouse. The untimely loss of this fine scientist is felt widely in the developmental biology community, and we hope that this book will keep alive her achievements in the quest for a better understanding of mouse development.
